AltrX liners are designed to work with the Pinnacle Acetabular Cup System, which provides a range of acetabular cup options, biological and mechanical fixation alternatives and advanced bearing technologies to provide surgeons the power to choose the precise combination that best meets the individual needs of each patient.

The Pinnacle system was developed with a team of surgeon thought-leaders from across the country. They allowed the proven Porocoat® Porous Coating fixation and combined it with engineering advances such as the patented Variable Interface Prosthesis (VIP) taper technology. This allows for the support of optimum performance metal and cross-linked polyethylene liners without compromising cup/insert congruency:

- Over 400,000 implanted
- 99.9 percent survivorship at 5 years

**A SOLID FOUNDATION**

AltrX™ was built on the proven clinical heritage of Marathon® cross-linked polyethylene. Introduced in 1998, Marathon was the first FDA-cleared cross-linked polyethylene in orthopaedics.

To address a growing trend toward high demand patients, AltrX was developed to reduce wear by 92 percent versus standard polyethylene and 51 percent versus Marathon while maintaining the same mechanical integrity and oxidative stability as Marathon.

92% WEAR REDUCTION

AltrX polyethylene starts with a base resin bar stock of GUR 1020 and is then moderately cross-linked at 7.5 Mrads, resulting in a material that is mechanically tough while providing 92 percent reduction in wear and resistance to oxidation.

OXIDATIVE STABILITY

AltrX material is remelted in an argon convection to consistently eliminate free radicals and oxidative potential. Annealed polyethylenes do not eliminate oxidation.

MECHANICAL INTEGRITY

AltrX polyethylene uses an exclusive Altra-Link™ material enhancement process to optimize the balance between wear reduction and mechanical integrity.

Compared with a 3X-annealed polyethylene, AltrX material has superior toughness, which reduces the risk of failures due to impingement or rim loading.

HIGH STABILITY, LOW WEAR

To enhance stability, AltrX liners are available in 36mm inner-diameter (ID) and now AltrX LD 40, 44 and 48mm ID. AltrX liners are available in neutral, lateralized, face changing, and lipped designs.

With a focus on wear reduction, AltrX liners are potentially less susceptible to higher wear as a function of head size.

**AN ALTERNATIVE FOR HIGH DEMAND PATIENTS**

BIOLOX® delta heads on AltrX liners provide a low wear solution for younger high demand patients. AltrX liners with delta heads produce 33 percent less volumetric wear than AltrX liners with cobalt chrome heads.

This bearing combination is also less susceptible to scratching and increased wear from third body debris such as bone cement or bone fragments.
